OPEN TOP & FLAT BOTTOM

The open-top bulk bag is a quick-filling solution, which is ideal for plant use. It's commonly used for building materials and scrap products.

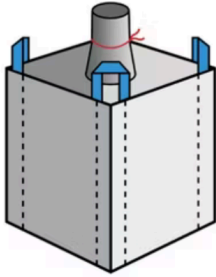

TIE- DOWN FLAP

Ideal for quick-filling applications, the tie-down flap allows for rapid fill whilst allowing the load to be securely transported and stored.

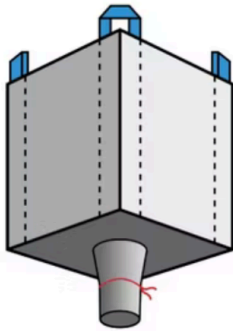

SKIRT TOP

Another popular choice for quick-filling applications, the bag top opens and extrudes outwards to allow for filling; the top can then be tied to ensure the load is securely contained.

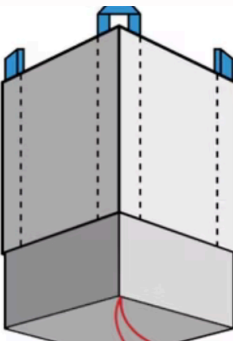

INLET SPOUT TOP

This is a great solution for those requiring a constant flow. The cone top can be attached to pipes or filling spouts to prevent dusting and loss. Once the FIBC is full, the spout can be tied to secure the product.

BOTTOM VALVE

The valve bottom bulk bag is ideal for those requiring a convenient solution to control the flow of the product out of the bulk

FULL OPEN BOTTOM

The open bottom bulk bag is the perfect solution for those requiring a rapid release of product, and is ideal for bulk powders or solids.

WE JUST DONT MAKE BAGS – WE BUILT TRUST

FIBC BULK BAGS

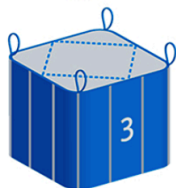

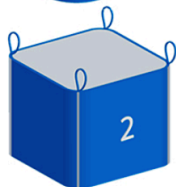

What does FIBC stand for?

The full FIBC meaning is "Flexible Intermediate Bulk Container." These large, durable bags are made from woven polypropylene and used to store and transport bulk materials. FIBCs are cost-effective for industries requiring strength, flexibility, and easy handling for dry goods like powders, pellets, and grains.

FIBCs/bulk bags are designed to support heavy loads while maintaining stability during shipping or storage. Depending on the environment and material sensitivity, FIBCs can offer static protection, UV resistance, or moisture barriers. Selecting the right type—like Type A FIBCs or Type B bags—ensures safety and performance in your specific application.

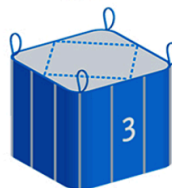

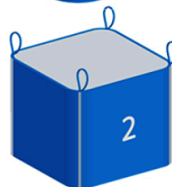

GHANSHYAM

Construction Style

Construction Style
While composing your big bags you can choose from the following options for the construction (bag's body):

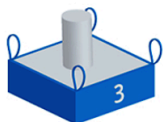

1. Round-woven construction
2. U-panel construction
3. Q-bag construction (form-stable implementation)
4. One loop construction

Loop Style

While composing your big bags you can choose from the following options for the loops:

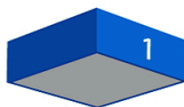

1. Four-point hanging system (standard)
2. Cross-corner loops (slings)
3. Tunnel loops (slings)

Top Style

While composing your big bags you can choose from the following options for the top:

1. Open top
2. Filling skirt
3. Filling spout

Bottm Style

While composing your big bags you can choose from the following options for the bottom:

1. Closed
2. Discharge spout
